

BUILDING RETRO-COMMISSIONING

Building systems in large facilities can often become inefficient over time. The Ameren Missouri BizSavers® Building Retro-Commissioning (RCx) program seeks to improve how equipment and systems function together. The RCx program is best suited for facilities with energy management systems controlling over 100,000 ft² or have higher than normal energy intensities. RCx also solves a lot of inherent problems larger buildings typically experience such as over-cooling, simultaneous heating and cooling, and inappropriate outdoor air levels. The Building RCx program incentivizes energy efficiency measures that have a simple payback of 18 months or less.

Benefits of Building Retro-Commissioning include:

- Reduce utility bills
- Increase operating margins and income
- Better understanding of facility needs
- Energy savings
- Improved comfort
- Extended equipment life
- Indoor air quality improvement
- Reduce carbon emissions

RCx projects can receive a **2¢-3¢ per kWh saved** incentive for performing a technical analysis study and a **9¢-22¢ per kWh saved** incentive for energy-efficient system upgrades.
